

Update on Covid-19 (Coronavirus)

02 September 2020

The worldwide Covid-19 or Coronavirus outbreak is a rapidly changing situation. This information is correct as of 02 September 2020, and will be updated if the advice or situation changes.

Background

Covid-19 is a coronavirus, part of a large family of viruses that cause a range of illness in humans, from the common cold to Severe Acute Respiratory Syndrome (SARS). The first case of a new Coronavirus (COVID-19) was reported on the 31 December 2019 in Wuhan in the Hubei Province of China. The initial outbreak in China has now spread to many other countries around the world, including the UK.

Current situation

The outbreak of Covid-19 was declared a pandemic on 12th March, and is now in most countries across the world, with numbers still increasing. The risk to individuals is high. On 2nd September there were 25 541 380 confirmed cases, with 852 000 deaths in 217 countries.

The current situation is ongoing, with many governments and countries putting in measures to control the spread of the virus. In some countries the measures are starting to ease, whilst in others they are getting more restrictive. These measures vary depending on where you are, so please see local government websites for more information.

Our Thrive recommendation is still to minimise travel to all but essential travel, and for people to work at home wherever possible, and to maintain contact using telephone or video conferencing technology.

We have advice sheets about minimising the psychological impact of isolation, and how to work virtually.

We are available to provide tailored advice to individuals and organisations. Please contact us if you would like more advice by emailing:

info@thrive-worldwide.org.

What are the symptoms of Covid-19?

Most people will experience mild to moderate respiratory illness and recover without requiring special treatment. The risk is higher for older people, those with reduced immunity, or those with pre-existing illnesses, particularly diseases affecting the lungs and heart.

Common symptoms include

- Fever (over 38C)
- New, continuous, dry cough
- Loss of, or change to, sense of taste and smell
- Tiredness
- Shortness of breath
- Weakness and malaise
- Muscle and joint aches

Symptoms can be similar to the common cold or flu.

How can someone catch Covid-19?

The incubation period is up to 14 days: this means that it can take someone up to 2 weeks to develop symptoms having been exposed to the virus. It is spread through droplets via coughing or discharge from the nose through sneezing, and also from environmental contact, i.e. touching surfaces touched by an infected person.

How can I protect myself from Covid-19?

The best way to prevent the virus spreading is by avoiding contact with individuals with the infection, and also by maintaining good respiratory and hand hygiene practices. The Department of Health (UK) and the World Health Organisation have issued the following guidance:

- Wash your hands often with soap and water for at least 20 seconds. Use an alcohol-based hand sanitiser that contains at least

60% alcohol if soap and water are not available. This is particularly important after taking public transport, or being in public places.

- Avoid touching your eyes, nose, and mouth with unwashed hands.
- Maintain social distancing (at least 1 meter, ideally 2 meters).
- If you feel unwell, stay at home, do not go to work. Current advice in the UK for anyone who has symptoms is to self-isolate for 10 days (stay at home, and minimise contact with other people).
- Cover your cough or sneeze with a tissue, then throw the tissue in a bin.
- Clean and disinfect frequently touched objects and surfaces in the home and work environment.
- Face coverings (masks) may help us protect each other and reduce the spread of the disease if you are in an enclosed space where social distancing isn't possible and where you would come into contact with people that you would not normally meet.

What treatment is available?

- A vaccine is not currently available but there are ongoing clinical trials for potential treatments.
- Treatment is supportive and aims to relieve the symptoms while your body fights the illness.
- Antibiotics will not help as they do not work against viruses.
- You will need to self-isolate away from other people for 7 days

Travel advice

There are travel restrictions to and from many countries, with border restrictions and reduced flights and quarantine periods in some places. Some countries and airlines are requesting evidence of negative PCR COVID-19 swab prior to travel (varying from 72 hours - 1 week prior to arrival). If you need to travel, then up to date travel advice in the UK can be found on the FCO website. For other countries, please see your government's advice about travel.
